- Next few lectures:
 - ▶ How do we measure concepts?
 - ▶ Using data to describe the world
 - ▶ Numerical summaries of variables

Causality understanding check

2/ Measurement

Concepts & measurement

- Social science is about developing and testing **causal theories**:

Concepts & measurement

- Social science is about developing and testing **causal theories**:
 - ▶ Does minimum wage change levels of employment?

Concepts & measurement

- Social science is about developing and testing **causal theories**:
 - ▶ Does minimum wage change levels of employment?
 - ▶ Does outgroup contact influence views on immigration?

Concepts & measurement

- Social science is about developing and testing **causal theories**:
 - ▶ Does minimum wage change levels of employment?
 - ▶ Does outgroup contact influence views on immigration?
- Theories are made up of **concepts**:

Concepts & measurement

- Social science is about developing and testing **causal theories**:
 - ▶ Does minimum wage change levels of employment?
 - ▶ Does outgroup contact influence views on immigration?
- Theories are made up of **concepts**:
 - ▶ Minimum wage, level of employment, outgroup contact, views on immigration.

Concepts & measurement

- Social science is about developing and testing **causal theories**:
 - ▶ Does minimum wage change levels of employment?
 - ▶ Does outgroup contact influence views on immigration?
- Theories are made up of **concepts**:
 - ▶ Minimum wage, level of employment, outgroup contact, views on immigration.
 - ▶ We took these for granted when talking about causality.

Concepts & measurement

- Social science is about developing and testing **causal theories**:
 - ▶ Does minimum wage change levels of employment?
 - ▶ Does outgroup contact influence views on immigration?
- Theories are made up of **concepts**:
 - ▶ Minimum wage, level of employment, outgroup contact, views on immigration.
 - ▶ We took these for granted when talking about causality.
- Important to consider how we **measure** these concepts.

Concepts & measurement

- Social science is about developing and testing **causal theories**:
 - ▶ Does minimum wage change levels of employment?
 - ▶ Does outgroup contact influence views on immigration?
- Theories are made up of **concepts**:
 - ▶ Minimum wage, level of employment, outgroup contact, views on immigration.
 - ▶ We took these for granted when talking about causality.
- Important to consider how we **measure** these concepts.
 - ▶ Some more straightforward: what is your age?

Concepts & measurement

- Social science is about developing and testing **causal theories**:
 - ▶ Does minimum wage change levels of employment?
 - ▶ Does outgroup contact influence views on immigration?
- Theories are made up of **concepts**:
 - ▶ Minimum wage, level of employment, outgroup contact, views on immigration.
 - ▶ We took these for granted when talking about causality.
- Important to consider how we **measure** these concepts.
 - ▶ Some more straightforward: what is your age?
 - ▶ Others more complicated: what does it mean to “be liberal”?

Concepts & measurement

- Social science is about developing and testing **causal theories**:
 - ▶ Does minimum wage change levels of employment?
 - ▶ Does outgroup contact influence views on immigration?
- Theories are made up of **concepts**:
 - ▶ Minimum wage, level of employment, outgroup contact, views on immigration.
 - ▶ We took these for granted when talking about causality.
- Important to consider how we **measure** these concepts.
 - ▶ Some more straightforward: what is your age?
 - ▶ Others more complicated: what does it mean to “be liberal”?
 - ▶ Have to create an **operational definition** of a concept to make it into a variable in our dataset.

Example

- Concept: presidential approval.

Example

- Concept: presidential approval.
- Conceptual definition:

Example

- Concept: presidential approval.
- Conceptual definition:
 - ▶ Extent to which US adults support the actions and policies of the current US president.

Example

- Concept: presidential approval.
- Conceptual definition:
 - ▶ Extent to which US adults support the actions and policies of the current US president.
- Operational definition:

Example

- Concept: presidential approval.
- Conceptual definition:
 - ▶ Extent to which US adults support the actions and policies of the current US president.
- Operational definition:
 - ▶ “On a scale from 1 to 5, where 1 is least supportive and 5 is more supportive, how much would you say you support the job that Donald Trump is doing as president?”

Measurement error

- **Measurement error:** chance variation in our measurements.

Measurement error

- **Measurement error:** chance variation in our measurements.
 - ▶ individual measurement = exact value + chance error

Measurement error

- **Measurement error:** chance variation in our measurements.
 - ▶ individual measurement = exact value + chance error
 - ▶ chance errors tend to cancel out when we take averages.

Measurement error

- **Measurement error:** chance variation in our measurements.
 - ▶ individual measurement = exact value + chance error
 - ▶ chance errors tend to cancel out when we take averages.
- No matter how careful we are, a measurement could have always come out differently.

Measurement error

- **Measurement error:** chance variation in our measurements.
 - ▶ individual measurement = exact value + chance error
 - ▶ chance errors tend to cancel out when we take averages.
- No matter how careful we are, a measurement could have always come out differently.
 - ▶ Panel study of 19,000 respondents: 20 reported being a citizen in 2010 and then a non-citizen in 2012.

Measurement error

- **Measurement error:** chance variation in our measurements.
 - ▶ individual measurement = exact value + chance error
 - ▶ chance errors tend to cancel out when we take averages.
- No matter how careful we are, a measurement could have always come out differently.
 - ▶ Panel study of 19,000 respondents: 20 reported being a citizen in 2010 and then a non-citizen in 2012.
 - ▶ Data entry errors.

Measurement error

- **Measurement error:** chance variation in our measurements.
 - ▶ individual measurement = exact value + chance error
 - ▶ chance errors tend to cancel out when we take averages.
- No matter how careful we are, a measurement could have always come out differently.
 - ▶ Panel study of 19,000 respondents: 20 reported being a citizen in 2010 and then a non-citizen in 2012.
 - ▶ Data entry errors.
- **Bias:** systematic errors for all units in the same direction.

Measurement error

- **Measurement error:** chance variation in our measurements.
 - ▶ individual measurement = exact value + chance error
 - ▶ chance errors tend to cancel out when we take averages.
- No matter how careful we are, a measurement could have always come out differently.
 - ▶ Panel study of 19,000 respondents: 20 reported being a citizen in 2010 and then a non-citizen in 2012.
 - ▶ Data entry errors.
- **Bias:** systematic errors for all units in the same direction.
 - ▶ individual measurement = exact value + bias + chance error.

Measurement error

- **Measurement error:** chance variation in our measurements.
 - ▶ individual measurement = exact value + chance error
 - ▶ chance errors tend to cancel out when we take averages.
- No matter how careful we are, a measurement could have always come out differently.
 - ▶ Panel study of 19,000 respondents: 20 reported being a citizen in 2010 and then a non-citizen in 2012.

- **Bias:** systematic errors for all units in the same direction.
 - ▶ individual measurement = exact value + bias + chance error.
 - ▶ “What did you eat yesterday?” \rightsquigarrow underreporting

A biased poll?

VZW Wi-Fi 18:23 33%

gop.com

Official Presidential Job Performance Poll

1. How would you rate President Trump's job performance so far?
 - Great
 - Good
 - Okay
 - Other
2. (Optional) Please explain why you selected your response.

3/ Descriptive Statistics

Goal

- A **variable** is a series of measurements about some concept.

Goal

- A **variable** is a series of measurements about some concept.
- **Descriptive statistics** are numerical summaries of those measurements.

Goal

- A **variable** is a series of measurements about some concept.
- **Descriptive statistics** are numerical summaries of those measurements.
 - ▶ If we smart enough, we wouldn't need them: just look at the list of numbers and completely understand.

- A **variable** is a series of measurements about some concept.
- **Descriptive statistics** are numerical summaries of those measurements.
 - ▶ If we smart enough, we wouldn't need them: just look at the list of numbers and completely understand.
- Two salient features of a variable that we want to know:

- A **variable** is a series of measurements about some concept.
- **Descriptive statistics** are numerical summaries of those measurements.
 - ▶ If we smart enough, we wouldn't need them: just look at the list of numbers and completely understand.
- Two salient features of a variable that we want to know:
 - ▶ **Central tendency**: where is the middle/typical/average value.

Goal

- A **variable** is a series of measurements about some concept.
- **Descriptive statistics** are numerical summaries of those measurements.
 - ▶ If we smart enough, we wouldn't need them: just look at the list of numbers and completely understand.
- Two salient features of a variable that we want to know:
 - ▶ **Central tendency**: where is the middle/typical/average value.
 - ▶ **Spread** around the center: are all the data close to the center or spread out?

Center of the data

- “Center” of the data: typical/average value.

Center of the data

- “Center” of the data: typical/average value.
- **Mean:** sum of the values divided by the number of observations

Center of the data

- “Center” of the data: typical/average value.
- **Mean:** sum of the values divided by the number of observations
- **Median:**

Center of the data

- “Center” of the data: typical/average value.
- **Mean:** sum of the values divided by the number of observations
- **Median:**

$$\text{median} = \begin{cases} \text{middle value} & \text{if number of entries is odd} \\ \frac{\text{sum of two middle values}}{2} & \text{if number of entries is even} \end{cases}$$

Center of the data

- “Center” of the data: typical/average value.
- **Mean:** sum of the values divided by the number of observations
- **Median:**

$$\text{median} = \begin{cases} \text{middle value} & \text{if number of entries is odd} \\ \frac{\text{sum of two middle values}}{2} & \text{if number of entries is even} \end{cases}$$

- Median more robust to **outliers:**

Center of the data

- “Center” of the data: typical/average value.
- **Mean:** sum of the values divided by the number of observations
- **Median:**

$$\text{median} = \begin{cases} \text{middle value} & \text{if number of entries is odd} \\ \frac{\text{sum of two middle values}}{2} & \text{if number of entries is even} \end{cases}$$

- Median more robust to **outliers:**
 - ▶ Example 1: data = {0, 1, 2, 3, 5}.

Center of the data

- “Center” of the data: typical/average value.
- **Mean:** sum of the values divided by the number of observations
- **Median:**

$$\text{median} = \begin{cases} \text{middle value} & \text{if number of entries is odd} \\ \frac{\text{sum of two middle values}}{2} & \text{if number of entries is even} \end{cases}$$

- Median more robust to **outliers:**
 - ▶ Example 1: data = {0, 1, 2, 3, 5}. mean =

Center of the data

Spread of the data

- Are the data close to the center?

Spread of the data

- Are the data close to the center?
- **Range:** $[\min(X), \max(X)]$

Spread of the data

- Are the data close to the center?
- **Range:** $[\min(X), \max(X)]$
- **Quantile** (quartile, quintile, percentile, etc):

Spread of the data

- Are the data close to the center?
- **Range:** $[\min(X), \max(X)]$
- **Quantile** (quartile, quintile, percentile, etc):
 - ▶ 25th percentile = lower quartile (25% of the data below this value)

Spread of the data

- Are the data close to the center?
- **Range:** $[\min(X), \max(X)]$
- **Quantile** (quartile, quintile, percentile, etc):
 - ▶ 25th percentile = lower quartile (25% of the data below this value)
 - ▶ 50th percentile = median (50% of the data below this value)

Spread of the data

- Are the data close to the center?
- **Range:** $[\min(X), \max(X)]$
- **Quantile** (quartile, quintile, percentile, etc):
 - ▶ 25th percentile = lower quartile (25% of the data below this value)
 - ▶ 50th percentile = median (50% of the data below this value)
 - ▶ 75th percentile = upper quartile (75% of the data below this value)

Spread of the data

- Are the data close to the center?
- **Range:** $[\min(X), \max(X)]$
- **Quantile** (quartile, quintile, percentile, etc):
 - ▶ 25th percentile = lower quartile (25% of the data below this value)
 - ▶ 50th percentile = median (50% of the data below this value)
 - ▶ 75th percentile = upper quartile (75% of the data below this value)
- **Interquartile range** (IQR): a measure of variability

Spread of the data

- Are the data close to the center?
- **Range:** $[\min(X), \max(X)]$
- **Quantile** (quartile, quintile, percentile, etc):
 - ▶ 25th percentile = lower quartile (25% of the data below this value)
 - ▶ 50th percentile = median (50% of the data below this value)
 - ▶ 75th percentile = upper quartile (75% of the data below this value)
- **Interquartile range** (IQR): a measure of variability
 - ▶ How spread out is the middle half of the data?

Spread of the data

- Are the data close to the center?
- **Range:** $[\min(X), \max(X)]$
- **Quantile** (quartile, quintile, percentile, etc):
 - ▶ 25th percentile = lower quartile (25% of the data below this value)
 - ▶ 50th percentile = median (50% of the data below this value)
 - ▶ 75th percentile = upper quartile (75% of the data below this value)
- **Interquartile range** (IQR): a measure of variability
 - ▶ How spread out is the middle half of the data?
 - ▶ Is most of the data really close to the median or are the values spread out?

Spread of the data

- Are the data close to the center?
- **Range:** $[\min(X), \max(X)]$
- **Quantile** (quartile, quintile, percentile, etc):
 - ▶ 25th percentile = lower quartile (25% of the data below this value)
 - ▶ 50th percentile = median (50% of the data below this value)
 - ▶ 75th percentile = upper quartile (75% of the data below this value)
- **Interquartile range** (IQR): a measure of variability
 - ▶ How spread out is the middle half of the data?
 - ▶ Is most of the data really close to the median or are the values spread out?
- One definition of outliers: over $1.5 \times$ IQR above the upper quartile or below lower quartile.

Quartiles in R

- `summary()` gives quartiles:

Quartiles in R

- `summary()` gives quartiles:

```

```
## [1] 0.62
```

Quartiles in R

- `summary()` gives quartiles:

```
summary(minwageNJ$wageBefore)
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##      4.25   4.25   4.50   4.61   4.87   5.75
```

```
summary(minwageNJ$wageAfter)
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##      5.00   5.05   5.05   5.08   5.05   5.75
```

- `IQR()` calculates IQR:

```
IQR(minwageNJ$wageBefore)
```

```
## [1] 0.62
```

```
IQR(minwageNJ$wageAfter)
```

Quartiles in R

- `summary()` gives quartiles:

```
summary(minwageNJ$wageBefore)
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##      4.25   4.25   4.50   4.61   4.87   5.75
```

```
summary(minwageNJ$wageAfter)
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##      5.00   5.05   5.05   5.08   5.05   5.75
```

```
IQR(minwageNJ$wageBefore)
```

```
## [1] 0.62
```

```
IQR(minwageNJ$wageAfter)
```

```
## [1] 0
```

Standard deviation

- **Standard deviation:** On average, how far away are data points from the mean?

$$\text{standard deviation} = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

Standard deviation

- **Standard deviation:** On average, how far away are data points from the mean?

$$\text{standard deviation} = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

- Steps:

Standard deviation

- **Standard deviation:** On average, how far away are data points from the mean?

$$\text{standard deviation} = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

- Steps:
 1. Subtract each data point by the mean.

Standard deviation

- **Standard deviation:** On average, how far away are data points from the mean?

$$\text{standard deviation} = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

- Steps:
 1. Subtract each data point by the mean.
 2. Square each resulting difference.

Standard deviation

- **Standard deviation:** On average, how far away are data points from the mean?

$$\text{standard deviation} = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

- Steps:
 1. Subtract each data point by the mean.
 2. Square each resulting difference.
 3. Take the sum of these values

Standard deviation

- **Standard deviation:** On average, how far away are data points from the mean?

$$\text{standard deviation} = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

- Steps:
 1. Subtract each data point by the mean.
 2. Square each resulting difference.
 3. Take the sum of these values
 4. Divide by $n - 1$

Standard deviation

- **Standard deviation:** On average, how far away are data points from the mean?

$$\text{standard deviation} = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

- Steps:
 1. Subtract each data point by the mean.
 2. Square each resulting difference.
 3. Take the sum of these values
 4. Divide by $n - 1$
 5. Take the square root.

Standard deviation

- **Standard deviation:** On average, how far away are data points from the mean?

$$\text{standard deviation} = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

- Steps:
 1. Subtract each data point by the mean.
 2. Square each resulting difference.
 3. Take the sum of these values
 4. Divide by $n - 1$
 5. Take the square root.
- Sometimes n instead of $n - 1$

Standard deviation

- **Standard deviation:** On average, how far away are data points from the mean?

$$\text{standard deviation} = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

- Steps:
 1. Subtract each data point by the mean.
 2. Square each resulting difference.
 3. Take the sum of these values
 4. Divide by $n - 1$
 5. Take the square root.
- Sometimes n instead of $n - 1$
- **Variance** = standard deviation²

Standard deviation

- **Standard deviation:** On average, how far away are data points from the mean?

$$\text{standard deviation} = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2}$$

- Steps:
 1. Subtract each data point by the mean.
 2. Square each resulting difference.
 3. Take the sum of these values
 4. Divide by $n - 1$
 5. Take the square root.
- Sometimes n instead of $n - 1$
- **Variance** = standard deviation²
- Why not just take the average deviations from mean without squaring?

- Minimum wage data:

How large is large?

- Is a wage of 5.30 an hour large?

How large is large?

- Is a wage of 5.30 an hour large?
- Better question: is 5.30 large relative to the distribution of the data?

How large is large?

- Is a wage of 5.30 an hour large?
- Better question: is 5.30 large relative to the distribution of the data?
 - ▶ Big in one dataset might be small in another!

How large is large?

- Is a wage of 5.30 an hour large?
- Better question: is 5.30 large relative to the distribution of the data?
 - ▶ Big in one dataset might be small in another!
 - ▶ Different units, different spreads of the data, etc.

How large is large?

- Is a wage of 5.30 an hour large?
- Better question: is 5.30 large relative to the distribution of the data?
 - ▶ Big in one dataset might be small in another!
 - ▶ Different units, different spreads of the data, etc.
- Need a way to put any variable on **common units**.

How large is large?

- Is a wage of 5.30 an hour large?
- Better question: is 5.30 large relative to the distribution of the data?
 - ▶ Big in one dataset might be small in another!
 - ▶ Different units, different spreads of the data, etc.
- Need a way to put any variable on **common units**.
- **z-score**:

$$\text{z-score of } x_i = \frac{x_i - \text{mean of } x}{\text{standard deviation of } x}$$

How large is large?

- Is a wage of 5.30 an hour large?
- Better question: is 5.30 large relative to the distribution of the data?
 - ▶ Big in one dataset might be small in another!
 - ▶ Different units, different spreads of the data, etc.
- Need a way to put any variable on **common units**.
- **z-score**:

$$\text{z-score of } x_i = \frac{x_i - \text{mean of } x}{\text{standard deviation of } x}$$

- Interpretation:

- Better question: is 5.30 large relative to the distribution of the data?
 - ▶ Big in one dataset might be small in another!
 - ▶ Different units, different spreads of the data, etc.
- Need a way to put any variable on **common units**.
- **z-score**:

$$\text{z-score of } x_i = \frac{x_i - \text{mean of } x}{\text{standard deviation of } x}$$

- Interpretation:
 - ▶ Positive values above the mean, negative values below the mean

How large is large?

- Is a wage of 5.30 an hour large?
- Better question: is 5.30 large relative to the distribution of the data?
 - ▶ Big in one dataset might be small in another!
 - ▶ Different units, different spreads of the data, etc.
- Need a way to put any variable on **common units**.
- **z-score**:

$$\text{z-score of } x_i = \frac{x_i - \text{mean of } x}{\text{standard deviation of } x}$$

- Interpretation:
 - ▶ Positive values above the mean, negative values below the mean
 - ▶ Units now on the scale of **standard deviations away from the mean**

How large is large?

- Is a wage of 5.30 an hour large?
- Better question: is 5.30 large relative to the distribution of the data?
 - ▶ Big in one dataset might be small in another!
 - ▶ Different units, different spreads of the data, etc.
- Need a way to put any variable on **common units**.
- **z-score**:

$$\text{z-score of } x_i = \frac{x_i - \text{mean of } x}{\text{standard deviation of } x}$$

- Interpretation:
 - ▶ Positive values above the mean, negative values below the mean
 - ▶ Units now on the scale of **standard deviations away from the mean**
 - ▶ Intuition: data more than 3 SDs away from mean are rare.

z-score example

- Jane works at Hi Rise Bakery, where there's a tip jar.

z-score example

- Jane works at Hi Rise Bakery, where there's a tip jar.
- She's been keeping track of her daily tips:

z-score example

- Jane works at Hi Rise Bakery, where there's a tip jar.
- She's been keeping track of her daily tips:
 - ▶ Average tip of \$1.56 with a standard deviation of 20 cents.

z-score example

- Jane works at Hi Rise Bakery, where there's a tip jar.
- She's been keeping track of her daily tips:
 - ▶ Average tip of \$1.56 with a standard deviation of 20 cents.
- Yesterday, Jane got \$1.86 in tips. How big is this?

z-score example

- Jane works at Hi Rise Bakery, where there's a tip jar.
- She's been keeping track of her daily tips:
 - ▶ Average tip of \$1.56 with a standard deviation of 20 cents.
- Yesterday, Jane got \$1.86 in tips. How big is this?

$$\text{z-score} = \frac{186 - 156}{20} = \frac{30}{20} = 1.5$$

z-score example

- Jane works at Hi Rise Bakery, where there's a tip jar.
- She's been keeping track of her daily tips:
 - ▶ Average tip of \$1.56 with a standard deviation of 20 cents.
- Yesterday, Jane got \$1.86 in tips. How big is this?

$$\text{z-score} = \frac{186 - 156}{20} = \frac{30}{20} = 1.5$$

- Today she got \$0.56, what about that?

z-score example

- Jane works at Hi Rise Bakery, where there's a tip jar.
- She's been keeping track of her daily tips:
 - ▶ Average tip of \$1.56 with a standard deviation of 20 cents.
- Yesterday, Jane got \$1.86 in tips. How big is this?

$$\text{z-score} = \frac{186 - 156}{20} = \frac{30}{20} = 1.5$$

- Today she got \$0.56, what about that?

$$\text{z-score} = \frac{56 - 156}{20} = \frac{-100}{20} = -5$$

z-scores in R

- Calculate the z-score:

z-scores in R

- Calculate the z-score:

```
wage.mean <- mean(minwageNJ$wageAfter)
wage.sd <- sd(minwageNJ$wageAfter)
minwageNJ$wageAfter.z <- (minwageNJ$wageAfter - wage.mean)/wage.sd
```

z-scores in R

- Calculate the z-score:

```
wage.mean <- mean(minwageNJ$wageAfter)
wage.sd <- sd(minwageNJ$wageAfter)
minwageNJ$wageAfter.z <- (minwageNJ$wageAfter - wage.mean)/wage.sd
```

- Compare original to z-scores:

z-scores in R

- Calculate the z-score:

```
wage.mean <- mean(minwageNJ$wageAfter)
wage.sd <- sd(minwageNJ$wageAfter)
minwageNJ$wageAfter.z <- (minwageNJ$wageAfter - wage.mean)/wage.sd
```

- Compare original to z-scores:

```
## original
summary(minwageNJ$wageAfter)
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##      5.00   5.05   5.05   5.08   5.05   5.75
```

z-scores in R

- Calculate the z-score:

```
wage.mean <- mean(minwageNJ$wageAfter)
wage.sd <- sd(minwageNJ$wageAfter)
minwageNJ$wageAfter.z <- (minwageNJ$wageAfter - wage.mean)/wage.sd
```

- Compare original to z-scores:

```
## original
summary(minwageNJ$wageAfter)
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##      5.00   5.05   5.05   5.08   5.05   5.75
```

```
## z-scores
summary(minwageNJ$wageAfter.z)
```

```
##      Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##     -0.77  -0.30  -0.30   0.00  -0.30   6.33
```
